cryptography = hidden writing (Greek)

*From Harvard CS50*

# cipher, cypher

- Origins: meant "zero" or circle
- Then meant number, doing arithmetic
- Then meant **encoding** text, hidden

cipher, cypher

Caesar cipher

Caesar shift

Substitution  
cipher

military messages,  
1st cent. CE

Original Message: "ATTACK AT DAWN"

SHIFT, or KEY: 3

Encrypted Message: "DWWDFN DW GDZQ"

## Caesar shift in c++ :

- String as input
-  shift as input
- Decrypted ciphertext as output

ENCRYPT

🔑 = 1

$90 - 65 = 25$

$25 + \text{🔑} = 26$

$26 \% 26 = 0$

$0 + 65 = 65 = \text{A}$

alphabet

**Alice and Bob**

Alice and Bob agree on a key  $K$

Secret key  $K$

**Alice**

Alice encrypts a message  $M$  using the key  $K$  and sends the encrypted message  $X$  to Bob.

Secret key  $K$

**Bob**

Bob receives the encrypted message  $X$  and decrypts  $X$  using the key  $K$  to obtain  $M$ .

$X$

MY NEW SECURE TEXTING APP  
ONLY ALLOWS PEOPLE NAMED  
ALICE TO SEND MESSAGES  
TO PEOPLE NAMED BOB.

vectors vs. arrays?

```
vector<int> myNumbers (20) ;
```

```
int myNumbers [20] ;
```

## vectors vs. arrays

- **BIG DIFFERENCE:**  
**YOU CANNOT SIMPLY RESIZE ARRAYS!**
- This makes arrays faster, if you are *really* in need of speedy performance (large, large datasets)
- Arrays don't need a header `#include`
- For our purposes, simpler to use dynamic vectors

`myContainer.at(i)` vs. `myContainer[i]`

- `.at()` function checks the size of your container
- `[]` does not check the range!
- Both work for vectors
- Only `[]` works for built-in arrays ... BUT ...

## C-strings vs. strings (C++)

```
char myWord[6] = "hello";  
string myWord = "hello";
```

- C-string = older, from C, built-in
- Literally array of characters, with `'\0'` to **END** (size = +1)
- Different library of functions than C++ strings
- Easy to make mistakes with!

## Why learn arrays + C-strings?

- We still see them in code ("legacy")
- Good to understand the most basic data types (like ... binary) to know where our more advanced features come from!
- Vectors came from limitations with arrays, the standard template string from limitations with C-strings, etc.!
